# A Closer Look: Scrapie Resistant Genetics within the U.S. Sheep Flock

---

Brad A. Freking

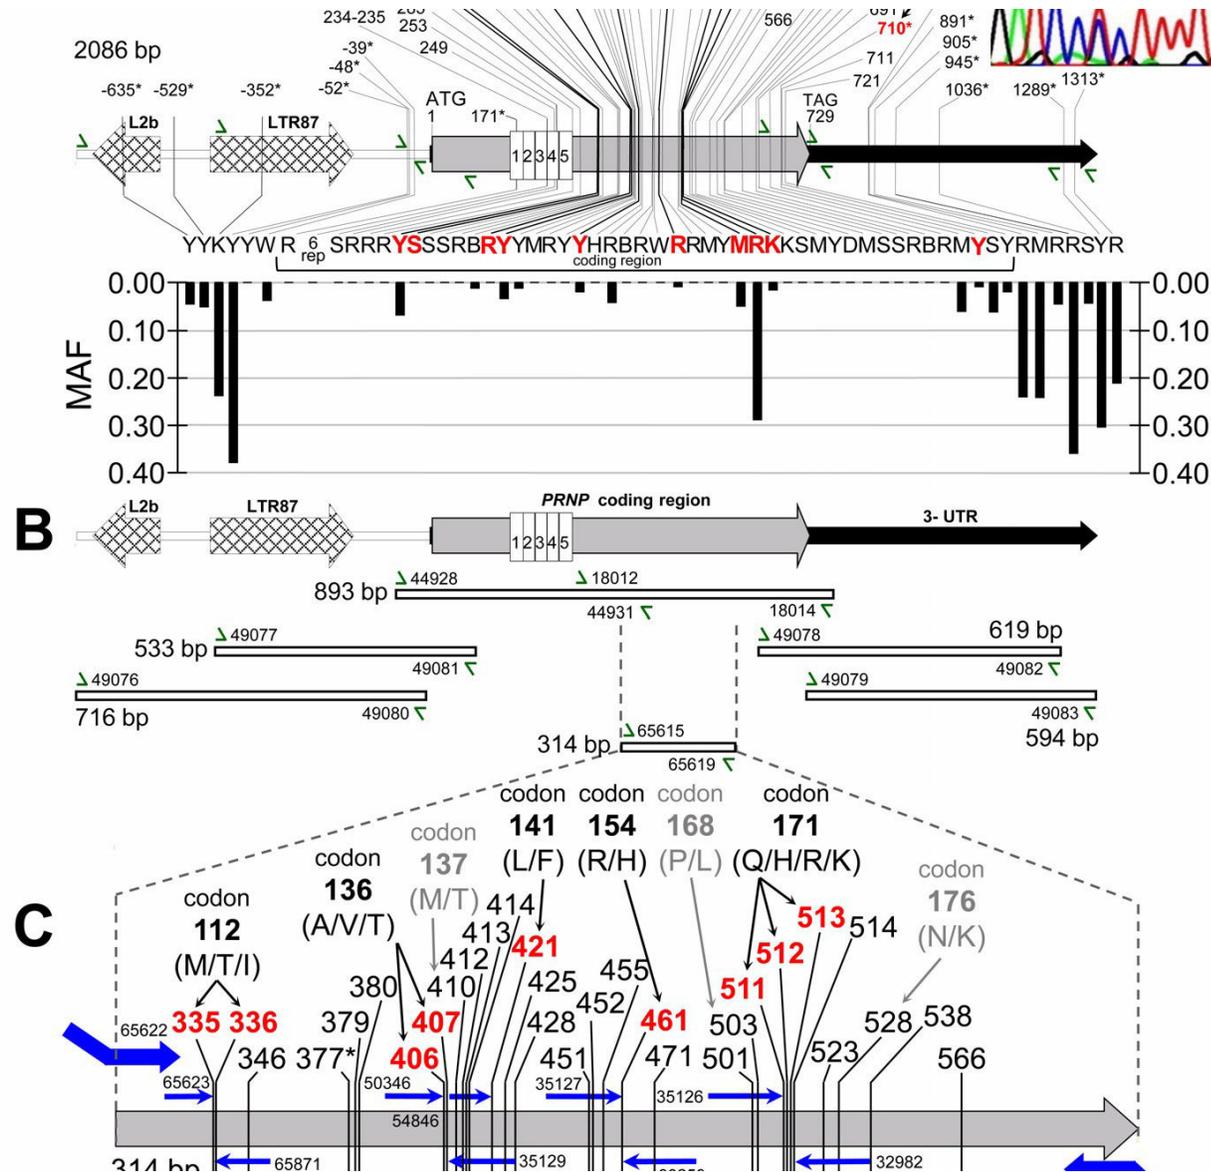

Agricultural Research Service  
U.S. DEPARTMENT OF AGRICULTURE

January 29, 2026

# Outline for today

---

- ❖ PRNP structure and variation
- ❖ Estimation of relevant allele freq. in Sheep GEMS populations (Rambouillet, Katahdin, Polypay, Suffolk)
- ❖ Relationships to NSIP trait EBVs
- ❖ An example of how to use genotype information to change a flock over time.

Lots !!  
Of variation at PRNP locus (Heaton et al., 2010)

Multiple alleles not inherited independently

# Scrapie (classical) Susceptibility

---

- Nucleotide variants affecting codons 136, 154, and 171 of the *PRNP* gene are the most often studied polymorphisms associated with variation in susceptibility to scrapie
  - Considering only the 136 and 171 codons :
    - Resistant (AA136, RR171)
    - Rarely susceptible (AA136, QR 171)
    - Somewhat susceptible (AV136, QR 171)
    - Highly susceptible (VV136, QQ 171)

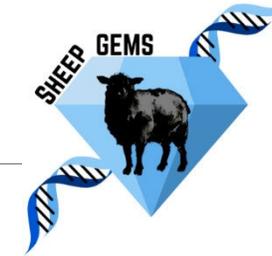

<https://scrapiecanada.ca/about-scrapie/>

# Genetic Conditions Validated

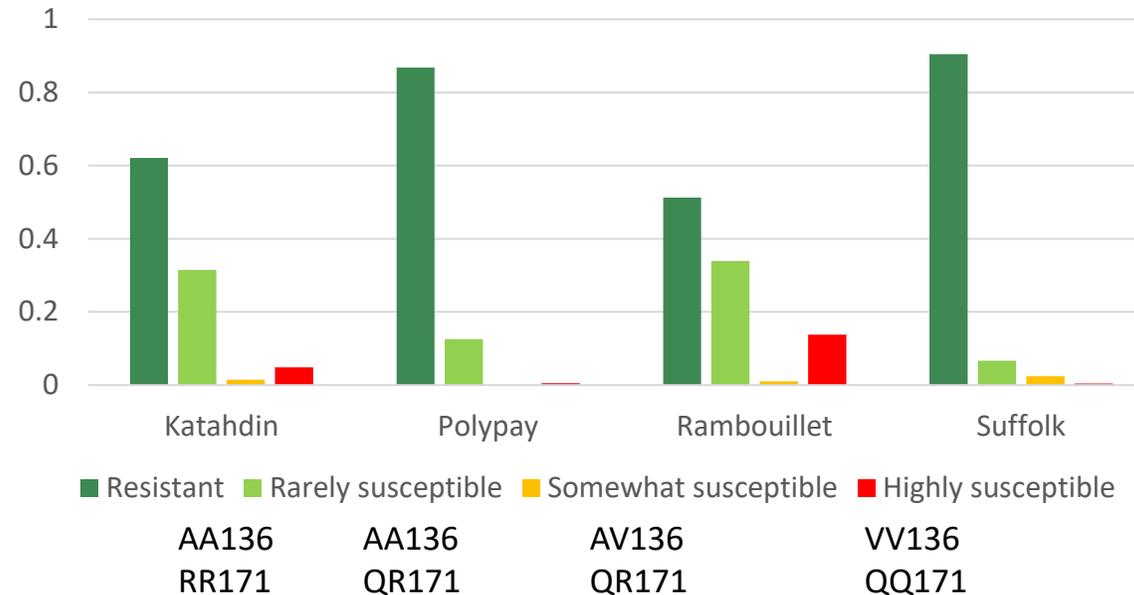

---

- Genetic Conditions from 50K chip
  - Scrapie susceptibility determined by multiple variants in *PRNP*
    - 23 unique probes for PRNP variation exists on the 50K chip
    - Blind submission of control samples had 100% concordance
    - Reports provided to NSIP producers for codons 136, 171

# Scrapie Susceptibility

Within Breed Frequency of *PRNP* genotypes

**Animals Genotyped**

Katahdin	14,775
Polypay	2,522
Rambouillet	2,757
Suffolk	2,163
<b>Total</b>	<b>22,217</b>

# Example of Associations reported

---

**Table 4. Significant contrasts for traits associated with *PRNP* haplotype in the Romanov breed of origin<sup>1</sup>**

Trait	Estimate	<i>P</i> -value	<u>Selection for ARR</u>
Rump width, cm	-0.35 ± 0.14	0.013	(-)
Carcass length, cm	0.84 ± 0.40	0.038	(+)
Longissimus marbling <sup>2</sup>	-48.4 ± 21.0	0.022	(-)

<sup>1</sup>Contrast between scrapie resistant (ARR) and the average of ARQ and VRQ *PRNP* haplotypes.

<sup>2</sup>Subjective marbling score in which 300 equals slight and 400 equals small.

Isler et al, 2006

Dorset x Romanov

# Example of Associations reported

Table 4

Estimated differences, standard error and significance of *t*-test compared to homozygote ARQ\*/ARQ\* genotype (model 2)

Genotype	EBV <sub>littersize</sub>			EBV <sub>135 days weight</sub>		
	Estimate	S.E.	Significance <sup>a</sup>	Estimate	S.E.	Significance <sup>a</sup>
ARQ*/ARR	0.605	0.108	b	0.098	0.132	
ARQ*/VRQ	2.182	0.311	b	2.360	0.382	b
ARQ*/AHQ	0.600	0.448		0.550	0.538	
ARR/ARR	1.103	0.147	b	- 0.203	0.179	
ARR/VRQ	1.977	0.364	b	1.889	0.445	b

<sup>a</sup>  $t < - 1.96$  or  $> 1.96 = b =$  significant.

Selection for ARR

Small (+) for litter size  
Small (-) For d135 wt

Five Breeds Wyoming  
and USSES

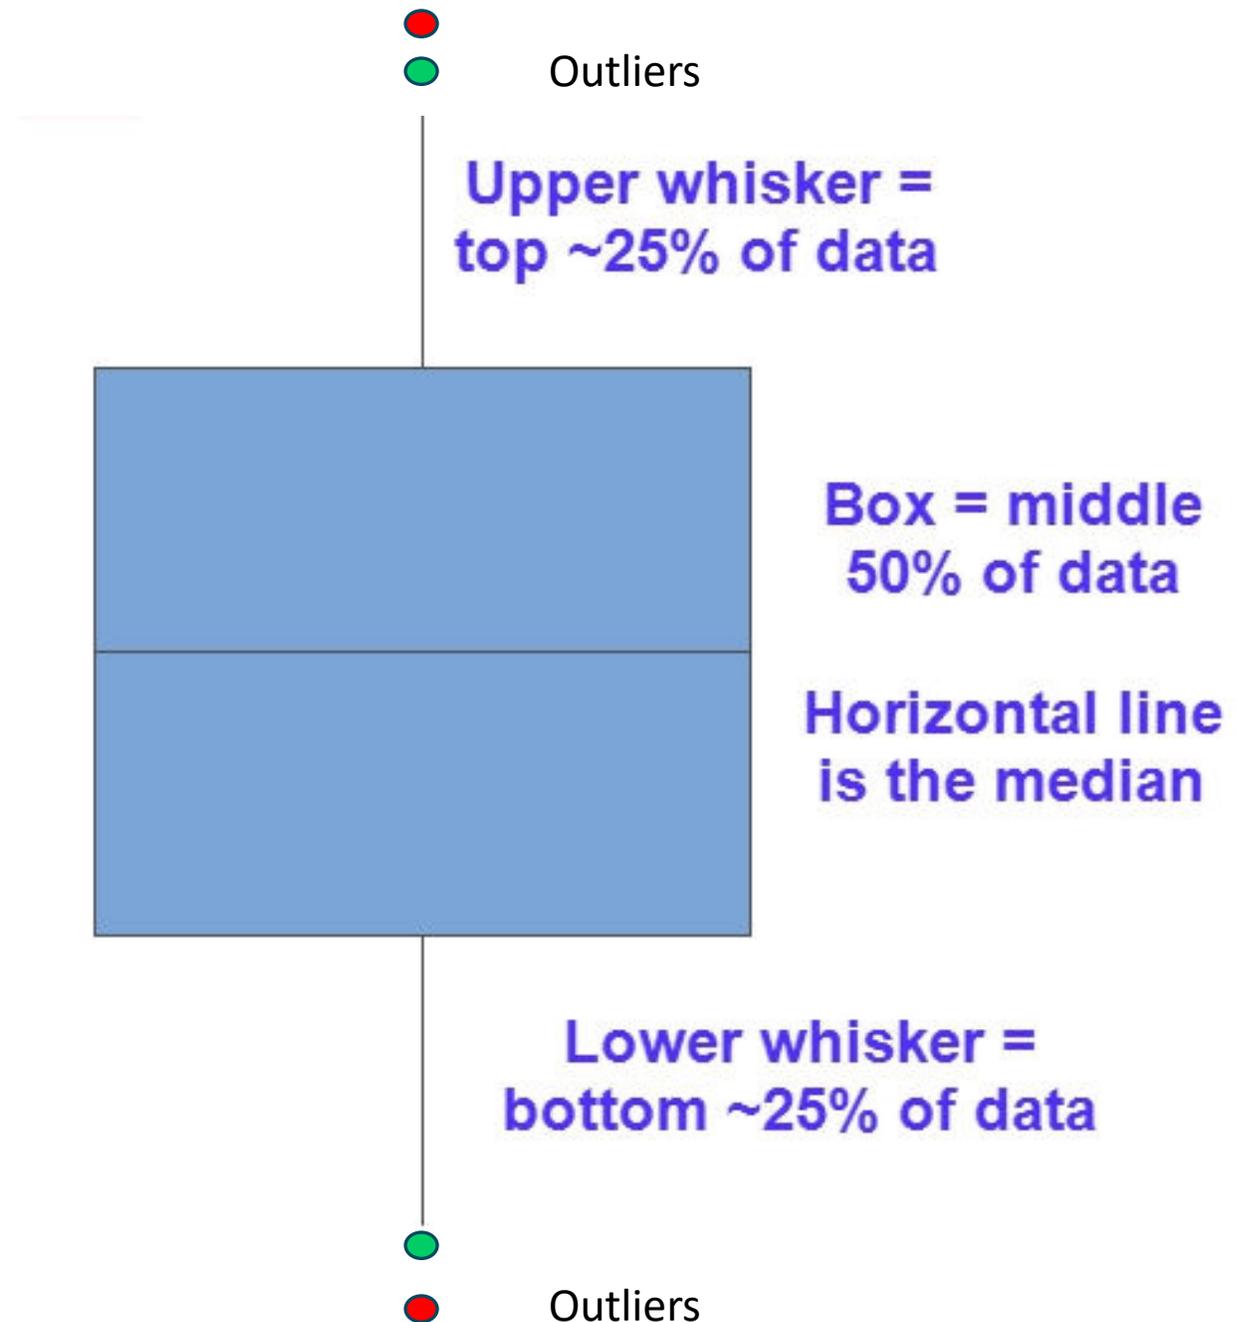

# GEMS data contribution to association testing

Lewis et al, unpublished

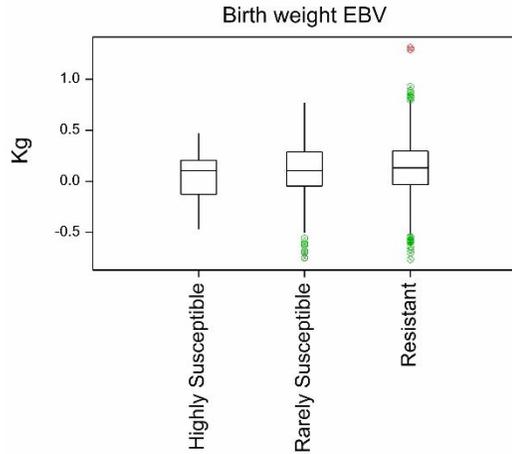

# What would cause a significant association ?

- Genes in linkage disequilibrium with PRNP on Chr 13
- Genetic bias among selected individuals
  - Different breeding value thresholds for QQ vs QR or RR rams ?
- Explain how to interpret box plots

# Polypay

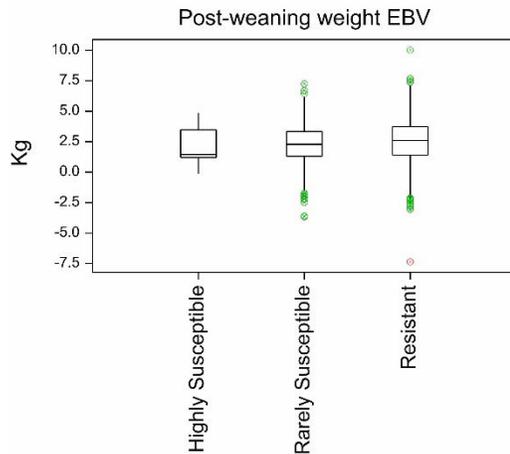

## Impact of PRNP class on EBVs for NSIP recorded traits

Net 0

○ NSIP breeding values within PRNP genotype groups

- Highly Susceptible (VV QQ) (18)
- Rarely Susceptible (AA QR) (448)
- Resistant (AA RR) (2301)
- Somewhat Susceptible (AV QR) (-)

# Example of within flock selection for PRNP

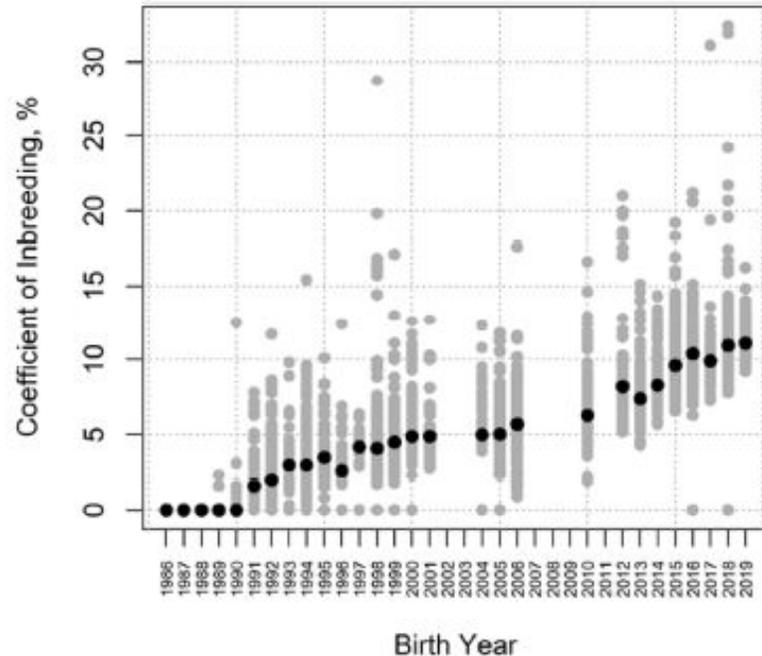

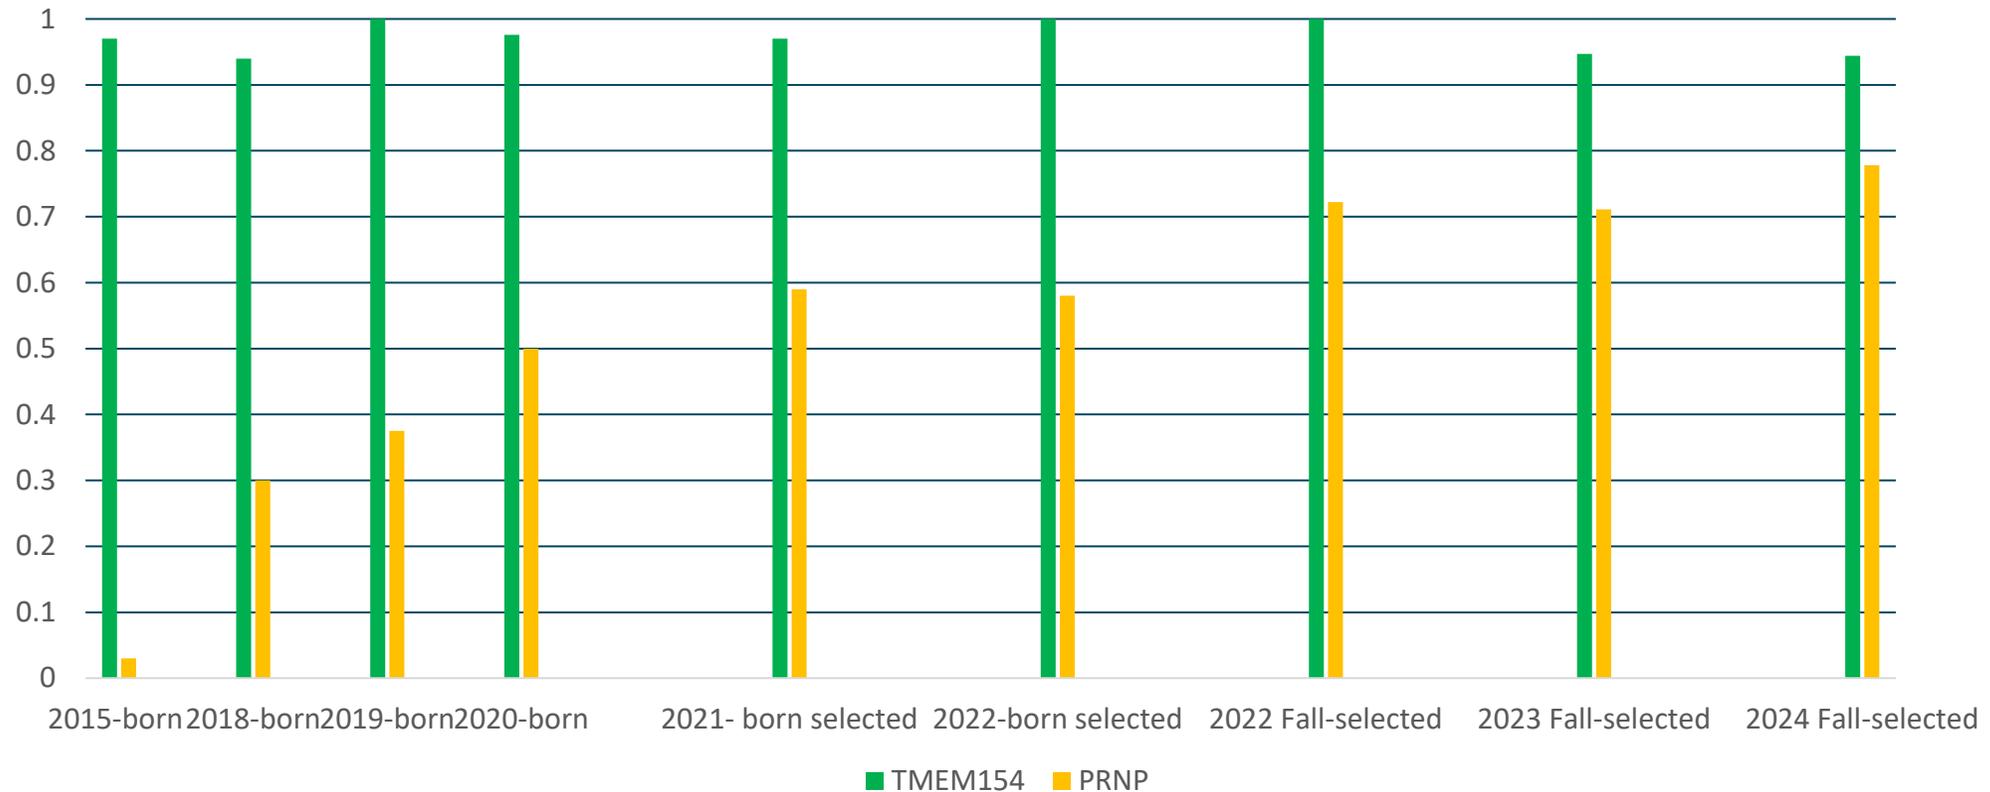

Figure 1. Individual (gray circles) and median (black circles) inbreeding coefficients by birth year for Romanov lambs born at the U.S. Meat Animal Research Center.

- USMARC Romanov flock (~ 300 ewes lambing annually)
  - Goal : Increase Freq of PRNP ARR and TMEM154 “1” without dramatically reducing genetic diversity of the flock.
  - Approach : Genotype candidate ram sons each year and select sons with more favorable genotype each year with all other selection objectives being equal. Only replace sire with a son if the genotype is as good or better than the sire.
  - Matings were assigned to minimize flock inbreeding, each ram (n=10-12 hd) exposed to equal number of ewes.

# Favorable allele frequency present in Romanov breeding status selected rams

Freking et al, unpublished

# Fixation of alleles without additional genotyping?

---

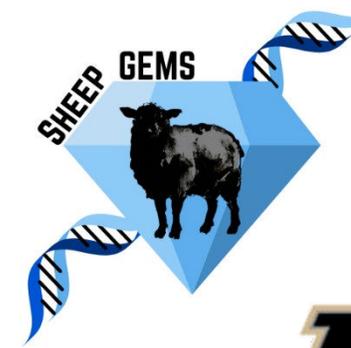

- Once allele frequency is reasonably higher, you can use male genotypes generated each year to identify dams in the flock that are either carriers or homozygous for the unfavorable allele

<u>Sires</u>	<u>Dams</u>	<u>Sons</u>
RR	??	QR

# Summary for PRNP status in U.S. sheep

---

- Breeds differ in current frequency of favorable haplotypes
  - Value is in insurance/protection for future exposure !
  - Options for breeds without favorable haplotypes include introgression and gene editing (regulatory approval?)
- Associated genetic changes due to PRNP selection are mostly small some favorable, some unfavorable
- Selection should be applied within the context of existing breeding objectives
